1. Opening — The Struggle Is Real

Hello everyone! Today, our group will present something every single person in this room desperately needs — *The Ultimate Survival Kit for University Students: Because We're All Barely Making It*.

Let's be honest: university isn't just about studying. It's about... **surviving**.

You survived course registration?

You survived professors who smile like angels but grade like demons?

You survived classes where the number of assignments is bigger than the number of slides in the PPT?

Congratulations — you're already halfway to becoming a legend.

(Show two courses with professor comments on the slide)

Now imagine this:

You can only choose **one** of these two courses.

Which one would you pick?

(Let audience react / laugh)

Yeah, we all know which one looks "less deadly."

But the real question is: **how do we survive the entire university cycle — from course registration, to attendance, to final exams — without losing our souls?**

Don't worry. Today, we will share our real-life trauma— I mean, *experiences* — so you won't have to suffer like we did.

2. Survival Lesson 1 — The Python Trap

Let me start with my first survival story:

Web/Python Programming — also known as "The Course That Looked Friendly but Was Actually a Horror Movie."

Our professor looked incredibly gentle.

Warm smile, calm voice... the type of professor you think will say,
"Don't worry, class, life is beautiful."

But no.

He was the kind of person who could say the most devastating things in the softest tone.

Everything seemed normal during the first 12 weeks.
No midterm exam, final project allowed AI, even ChatGPT — life was good.
We were happy. Too happy.
And that was the problem.

Because in Week 13, disaster struck.

During the mock exam, students were being a bit too loud.
Suddenly, the professor announced:
“Final exam will NOT allow any form of AI. Not even GitHub Copilot.”

At that moment, every engineering student in the room spiritually collapsed.
And the final exam was in... *less than one week*.

So here's Survival Tip 1:
Always, ALWAYS check professor reviews.
A gentle-looking professor does not mean a gentle class.
Senior students never lie — their comments are basically prophecy.

3. Survival Lesson #2 — The Calculus Catastrophe

Now, onto my second survival experience:
Calculus — The Course That Looked Harmless But Secretly Wanted Me Dead.

To make my Fridays free so I could have a 3-day weekend, I chose the online version of Calculus.
Big mistake.

In the beginning, the professor said we could use either the English textbook or the Korean-translated textbook.
Of course, I confidently chose the English one.

Everything went fine... until one week before the midterm.

I emailed the professor twice to ask:
“Will the exam be available in English?”

No reply.
Then I sent two text messages.
Still no reply.
At that point I thought, “Maybe he's just busy?”

No.
He wasn't busy.
He was plotting.

Midterm day came, and the exam paper was...

100% Korean.

And I had studied in English for half a semester.

International students in this room, I know you feel my pain.

So here's Survival Tip 2:

Avoid professors who don't reply to emails.

A professor who emails you too much is annoying.

But a professor who *never* checks emails?

That is truly terrifying.

4. Transition to Next Member — Passing the Torch

And these were just *my* survival stories.

University is basically a video game with new bosses every semester.

So now, let's move on to the next chapter of our Survival Kit.

I'll hand it over to **JIMIN**, who will reveal even more ways to stay alive in this beautiful academic jungle.
